

U.S. EPA Remote Sensing Information Gateway (RSIG)

Western States Air Resources Council Training Workshop on use of Satellite Data for Air Quality

August 5-6, 2025

Jim Szykman, US EPA ORD

Matt Freeman, US EPA EMVL – Applied Research Associates

Barron Henderson, US EPA ORD

Disclaimer: The views expressed in this presentation are those of the authors and do not necessarily reflect the views or policies of the U.S. Environmental Protection Agency.

Overview

- Intro to RSIG suite
- Selected dataset overview
- TEMPO Products and Validation with RSIG
- Introduction to RSIG3D Desktop App
- Hands-on Example

What is the Remote Sensing Information Gateway?

- Easy access to 100's of terabytes of high value air quality datasets
 - Free, multi-platform (windows/mac/linux), graphical or scriptable software.
 - 5000+ curated products including remote sensing, model, and in-situ datasets selected for Air Quality Manager staff.
 - Datasets selected through collaboration of EPA Air Quality Staff, SLT Air Quality Agencies, and other federal partners.
- Retrieve, visualize and save geospatial atmospheric datasets
 - Use RSIG3D desktop application to point and click to make maps and save as images or CSV files.
 - Use Excel, R, or python to make custom visualizations from saved outputs.
 - Python scriptable interface (pyrsig). pyrsig has example analyses by experienced EPA Air Quality Researchers that you can reuse.
- Compliant with EPA Quality Assurance Policies with multiple relevant QAPPs and supports several requirements under the CAA:
 - Research Program, Cooperative Research, Monitoring and Studies (Sections 103)
 - Enhanced Monitoring for Ozone and Associated Precursors (PAMS- Section 182)
 - Air quality monitoring (AQI reporting and Exceptional Events)

RSIG3D is the client graphical user

<https://www.epa.gov/rsig>

RSIG meets needs identified US Govt Accountability Office (GAO-21-38, 2020 under the 1st Trump Administration)

- RSIG delivers real-time, near-realtime monitor, PurpleAir, and satellite data
 - Because “Information needs are (1) local-scale, real-time air quality; (2) air toxics; (3) persistent and complex pollution; and (4) using low-cost sensors and satellites.”
 - “low-cost sensors measure criteria pollutants, such [**PM_{2.5}**] and ozone”, and
 - “satellites currently provide information related to ... **ozone, particulate matter, nitrogen dioxide, sulfur dioxide, and formaldehyde**” (and carbon monoxide and methane)
- RSIG gives easy access to satellite product from TEMPO, TropOMI, OMI, MODIS, and VIIRS because
 - “Satellites can provide information on air pollutants over large areas, including areas that are difficult or impossible to monitor with traditional monitoring methods.”
 - “Air quality managers, researchers... are increasingly using [satellites and low-cost sensors] to obtain information on air quality.”
- RSIG facilitates comparison to traditional observations and model results because:
 - Air Quality staff “need more information on the reliability and accepted uses of ... remote sensors on satellites operated by NOAA and NASA.”
 - “Satellite-based sensor data can be difficult to interpret, especially for pollution at ground level.”

Report can be found at: <https://www.gao.gov/products/gao-21-38>

RSIG connects you to popular datasets

- Ground Monitors (**AQS**, **AirNow**)
- Tropospheric Emissions: Monitoring of Pollution (**TEMPO**)
- EPA's Air QUALity Time Series (**EQUATES**)
- TROPOspheric Monitoring Instrument (**TROPOMI**)
- High-Resolution Rapid Refresh (**HRRR**)
- Moderate Resolution Imaging Spectroradiometer (**MODIS**)
- Visible Infrared Imaging Radiometer Suite (**VIIRS**)
- Cloud-Aerosol Lidar with Orthogonal Polarization (**CALIOP**)

RSIG Inventory: TropOMI and EPA's EQUATES CMAQ

pyrsig-based comparison of TropOMI vs EQUATES Column NO₂

- pyrsig used to query and subset
- EQUATES is filtered for only valid TropOMI Overpass times
- Scripted analysis will work for CMAQ or CAMx for any simulation

RSIG Inventory: Pandonia Global Network

Web Interface-based comparison of Pandora and Model

RSIG Inventory: Crowdsourced PurpleAir PM_{2.5} Air Sensor

- **Data Set Type:** Global, ground-based, publicly reporting crowdsourced PM_{2.5} data from a commercial network of air sensors. Data secured to reduce access costs for both EPA and the company. Use governed by Materials Transfer Agreement (requires research in collaboration with ORD).
- **Dates:** Network started ~2016; currently, 27,000+ indoor (~20%) and outdoor (80%) sensors operating globally
- **Variables:** Primarily measures PM_{2.5} (T, RH, PM₁, etc. also available); available in raw form but also as a quality assured and corrected data stream using EPA's U.S.-wide correction; available at various time averages; updated every minute.
- **Applications:** Public real-time air quality communication (e.g., AirNow Fire and Smoke Map), available as comparison data in data tools (e.g., RETIGO, ASNAT), research applications continue to grow (e.g., data fusion, model validation, more local air quality data, characterizing the impact of events and/or interventions)

Top: AirNow Fire and Smoke Map showing sensor locations each displaying the current NowCast AQI (accessed 7/15/25). **Bottom left:** PurpleAir PA-II-SD outdoor sensor. **Bottom Right:** Intern installing a sensor at a Nez Perce library.

Tropospheric Emissions: Monitoring of Pollution (TEMPO)

- Satellite dataset from NASA Earth Venture Instrument Program with daylight hourly scans (geostationary) over greater North America at urban scales
 - Dates: August 2023-present
 - Species: Nitrogen dioxide, Formaldehyde, ozone and ozone profiles
 - Total, tropospheric, and near surface (ozone) column abundances
 - Predetermined QA metrics
- Typical Application Uses: model evaluation, air quality event and trends analysis, pollutant emissions research, air pollutant exposure studies
- Data Latency:
 - Near-real-time: a few hours
 - Offline processing: less than a day

RSIG3D GUI Map example.

- Quantifying the quality of these products by decomposing the inherent uncertainty components is often a very challenging task and limited by appropriate independent geophysical measurements with appropriate levels of traceability.
- Historically validation for non-operational satellite science missions such as TEMPO have relied on episodic field campaigns and research measurements to assess data quality.
- Use of satellite data for air quality applications often lack the appropriate validation metrics to inform fitness for purpose, a more routine and systematic approach can help fill this void.

The screenshot shows the EPA Science Inventory page. At the top is the EPA logo and navigation links: Environmental Topics, Laws & Regulations, About EPA, and a search bar. The main heading is "Science Inventory". Below it is a breadcrumb trail: "You are here: EPA Home > Science Inventory > TROPOSPHERIC EMISSIONS: MONITORING OF POLLUTION (TEMPO) PROJECT Level 2 Science Data Product Validation Plan". The title of the document is "TROPOSPHERIC EMISSIONS: MONITORING OF POLLUTION (TEMPO) PROJECT Level 2 Science Data Product Validation Plan". There is a "Citation:" section with the following text: "Szykman, J., L. Valin, K. Chance, X. Liu, G. Abad, C. Nowlan, R. Cohen, D. Flittner, T. Hanisco, J. Herman, M. Newchurch, M. Johnson, J. Judd, R. Pierce, J. Sullivan, R. Stauffer, AND M. Tisdale. TROPOSPHERIC EMISSIONS: MONITORING OF POLLUTION (TEMPO) PROJECT Level 2 Science Data Product Validation Plan. NASA, Washington, DC, 2023." There is also an "Impact/Purpose:" section with the text: "The Tropospheric Emissions: Monitoring of Pollution (TEMPO) mission was launched from Spa". A QR code is located on the right side of the page.

- Plan and execution led by US EPA with input from the TEMPO Validation Team and a large group of scientist from NASA, NOAA, NCAR, ECCC, and Universities.
 - Developed Level 2 Data Validated Plan for baseline L2 data products: ozone, nitrogen dioxide, and formaldehyde, ozone profiles not included.
 - Plan centered around Product Specific Performance Indicators (PSPIs) for Beta, Provisional, and Full validation stages, providing a structured approach for the geophysical data product maturity progression and with specific metrics to be generated to provide a 'fit for purpose' applications framework.
 - **Helps address EPA, State, Local, and Tribal agency needs of assuring the suitability of this information for new applications, consistent with OMB and EPA Information Quality Guidelines.**
 - Analyses leverages a comprehensive set of existing measurements (ground-based and satellite) for routine validation enhanced by STAQS, AEROMMA, and CUPIDS field missions and modeling efforts.

EPA ORD Air, Climate and Energy Research Program filled a critical gap through expansion and network ops of pandora spectrometers across the U.S. aided by State and Local agencies monitoring staff

TEMPO L2 Total and Tropospheric NO₂

Product Maturity Levels & Product Specific Performance Indicators

Validation PSPI Analysis/Metric(s) contributed
voluntarily by many PIs/Research
Organizations

Product Validation Level	Product-Specific Performance Indicators (PSPIs)
Beta Validation: the product is minimally validated but may still contain significant errors; based on product quick looks using the initial calibration parameters. Publication of research based on Beta maturity products is not recommended and highly discouraged.	NO2-01: Distinguish high NO2 urban areas from nearby rural areas for three select urban-rural scene combinations.
	NO2-02: Assess bias and precision for at least one month of retrievals in comparison to independent correlative measurements to convey an initial characterization to the user community. The assessment should evaluate TEMPO's capability to observe diurnal variations.
	NO2-03: Identify two radiatively homogenous, cloud-clear, low tropospheric NO ₂ background scenes over a dark surface (e.g., water) and over a bright surface (e.g., snow, desert) under different solar zenith angles and compute point-to-point variability (1-σ) as an empirical estimate for fitting uncertainty. Compare and communicate empirical estimates with those derived from the spectral fitting process.
Provisional Validation: product performance has been demonstrated through a large, but still (seasonally or otherwise) limited number of independent measurements. The analysis is sufficient for limited qualitative determinations of product fitness-for-purpose, and the product is potentially ready for testing by operational users and may be suitable for scientific publication.	NO2-04: Assess performance metrics (bias/precision/uncertainty) of the tropospheric NO ₂ product across the CONUS for 1 month period in two seasons, preferably summer and winter, that includes a range of column densities.
	NO2-05: Conduct deep-dive analyses for an episode with relatively poor product performance, identify the root cause and recommend algorithm improvements.
Full Validation: product performance has been demonstrated over a large and wide range of representative conditions, with comprehensive documentation of product performance, including known anomalies and their remediation strategies. Products are ready for systematic use and covering the full range of scientific and application use and publication.	NO2-06: Assess bias, precision, and uncertainty of the tropospheric NO ₂ product across the CONUS for a wide range of representative conditions over a period of at least one year.
	NO2-07: Assess bias, precision, and uncertainty of the tropospheric NO ₂ product over areas of interest using data gathered during targeted field campaigns.

TEMPO L2 Total and Tropospheric NO₂

Product Maturity Levels & Product Specific Performance Indicators

Product Validation:	
Beta Validation: still contain significant uncertainties and may require further validation using the initial campaign data. Beta maturity level is based on Beta maturity level and is highly discouraged for use in scientific publications.	The PSPI's are like the EPA Data Quality Objectives Process and with flows from Information Quality Guidelines. Helps communicate if data are of sufficient quality and quantity to support the use of the data. NO2-01: Distinguish high NO2 urban areas from nearby rural areas for three select urban-rural scene combinations. PSPI included use of ground-based and airborne spectrometers which can capture such gradients and provide independent similar geophysical measurements. NO2-03: Identify two radiatively homogenous, cloud-clear, low tropospheric NO2 background scenes over a dark surface (e.g., water) and over a bright surface (e.g., snow, desert) under different solar zenith angles and compute point-to-point variability (1-σ) as an empirical estimate for fitting uncertainty. Compare and contrast with ground-based measurements.
Provisional Validation: demonstrated through a limited number of independent measurements. The analysis is sufficient for limited qualitative determinations of product fitness-for-purpose for testing by open access scientific publications.	summer and winter, that includes a range of column densities. poor product improvements.
Full Validation: over a large and varied range of conditions including known anomalies and their remediation strategies. Products are ready for systematic use and covering the full range of scientific and application use and publication.	NO2-07: Assess bias, precision, and uncertainty of the tropospheric NO2 product over areas of interest using data gathered during targeted field campaigns. ric NO2 product over a period of at

Validation PSPI Analysis/Metric(s) contributed voluntarily by many PIs/Research Organizations

- Validation results were discussed in bi-weekly telecons from Fall 2023-Winter 2024.
- Draft report submitted for review December 2024
- TEMPO L2 TropNO₂, TotHCHO, and TotO₃ V3 reached provisional status in December 2024 through the internal review by the validation team of the report
- Report publication expected August 2025
- Validation effort provided real-time feedback to TEMPO algorithm developers and science team.
 - Early results identified a priori profile issues.
 - Early results identified unrealistic AMF spatial variation.
 - Development team updated algorithm to V2 and V3
- ***RSIG used to support EPA's Automated Analysis System for validation***
 - Nitrogen dioxide correlating well with Pandora and TropOMI.
 - Formaldehyde correlating well with Pandora
 - Comparison to surface monitors useful for air quality managers

TEMPO Validation with pyrsig

- Correlative measurements : TropOMI and Pandora Spectrometers
 - Pandora stations: best ground-based validation dataset available for total vertical columns.
 - TropOMI: state-of-the-art satellite retrievals at similar spatial resolution.
- 96 Analysis Regions: Pandonia Global Network and Ozone Nonattainment Areas.

- 44 Pandora stations
- Most stations in the east

- 52 Nonattainment Areas
- Better spatial coverage
- Of special interest for emissions control

Pandora totHCHO Validation Aug 2023 to May 2025

@Pandora

line: 50% boxes: 25%-75%
Solid Boxes: Mon-Fri

**TEMPO captures
seasonal pattern
($r=0.98$) with good bias
(NMB=-3%)**

@Pandora

**TropOMI captures seasonal
pattern ($r=0.91$), but high in
winter (NMB=+12%)**

- Smaller variability in TropOMI
- TropOMI high-biased for low HCHO?

Pandora totNO₂ Validation Aug 2023 to May 2025

line: 50% boxes: 25%-75%
Solid Boxes: Mon-Fri

TEMPO captures seasonal pattern (r=0.82) with good bias (NMB=3%)

TropOMI captures seasonal pattern (r=0.88), but low (NMB=-14%)

- Smaller variability in TropOMI
- TropOMI low-biased for high NO₂?

TropOMI totNO₂ and tropNO₂ Eval @Pandora Aug 2023 to May 2025

line: 50% boxes: 25%-75%
Solid Boxes: Mon-Fri

**TEMPO captures
Pandora seasonal
pattern ($r=0.82$) with
good bias (NMB=3%)**

Using TropOMI as a reference

**As expected, TEMPO is higher
than TropOMI (NMB=+19%)**

**So, you might expect TEMPO
to be high biased over
Nonattainment Areas (NAA)**

TropOMI totNO₂ and tropNO₂ Eval @All Intersections Aug 2023 to May 2025

line: 50% boxes: 25%-75%
Solid Boxes: Mon-Fri

Unexpectedly TEMPO has lower NAA values (NMB=-11%)

- Pandora sites are typically in urban areas, mostly in the west
- NAA cover urban, but area dominated by suburbs/rural and area-wise are in the west (California).
- TropOMI may have a high-bias at low NO₂?

Need Pandoras at strategic suburban ad rural locations to provide ground truth.

Live demonstration of TEMPO Column NO₂ data within RSIG over SW U.S.

RSIG Summary

- Designed to assist users in obtaining complex datasets relevant to the air quality research and application community.
- Critical access to TropOMI, TEMPO, Pandora, AirNow, etc
- Significantly reduce data processing time associated with air quality relevant high value data sets.
- Provides data access via the RSIG3D user interface, web browser, cURL (client URL) scripts, or via pyrsig scripting.
- Visualization capabilities can be used to explore episode case studies and provide high quality graphics for reports and presentations.
